

# **Introduction to R software**

## **- Matrix Operations**

# Matrix Calculations

- Matrix Operations

# Matrix

A matrix is a rectangular array with **m rows** and **n columns**.

An element in the *i*-th row and *j*-th column is denoted by  **$X_{ij}$**  in text, or  **$X[i,j]$**  in programs, where

**$i = 1, 2, \dots, m,$**

**$j = 1, 2, \dots, n.$**

We consider only numerical matrices, whose elements are generally real numbers.

# m x n matrix

$$A_{(m \times n)} = \begin{bmatrix} a_{11} & a_{12} & . & . & . & a_{1n} \\ a_{21} & a_{22} & . & . & . & a_{2n} \\ . & . & . & . & . & . \\ . & . & . & . & . & . \\ . & . & . & . & . & . \\ a_{m1} & a_{m2} & . & . & . & a_{mn} \end{bmatrix}$$

# Matrix

In R, a  $4 \times 2$ -matrix  $X$  can be created with a following command:

```
> x = matrix( nrow=4, ncol=2, data=c(1,2,3,  
4,5,6,7,8) )
```

```
> x
```

|      | [,1] | [,2] |
|------|------|------|
| [1,] | 1    | 5    |
| [2,] | 2    | 6    |
| [3,] | 3    | 7    |
| [4,] | 4    | 8    |

# Matrix

- The parameter **nrow** defines the row number of a matrix.
- The parameter **ncol** defines the column number of a matrix.
- The parameter **data** assigns specified values to the matrix elements.
- The values from the parameters are written column-wise in matrix.

# Matrix

Access to single element:

```
> x
      [,1] [,2]
[1,]    1    5
[2,]    2    6
[3,]    3    7
[4,]    4    8
```

One can access a single element of a matrix with `x[i,j]`

```
> x[3,2]
[1] 7
```

*If we leave out either one of the subscripts, we'll get the entire row or column of the matrix, depending on which subscript we leave out.*

# Matrix: Access to rows, and columns

```
> x <- matrix(c(1:10), nrow=5, ncol=2)
```

```
> x
```

|      | [,1] | [,2] |
|------|------|------|
| [1,] | 1    | 6    |
| [2,] | 2    | 7    |
| [3,] | 3    | 8    |
| [4,] | 4    | 9    |
| [5,] | 5    | 10   |

```
> x[4,]
```

```
[1] 4 9
```

```
> x[,1]
```

```
[1] 1 2 3 4 5
```

# Matrix: Access to rows, columns or submatrices:

```
> x <- matrix(c(1:8), nrow = 4, ncol = 2, byrow = T)
```

```
> x
```

|      | [,1] | [,2] |
|------|------|------|
| [1,] | 1    | 2    |
| [2,] | 3    | 4    |
| [3,] | 5    | 6    |
| [4,] | 7    | 8    |

```
> x[1:3, 1:2]
```

|      | [,1] | [,2] |
|------|------|------|
| [1,] | 1    | 2    |
| [2,] | 3    | 4    |
| [3,] | 5    | 6    |

```
# submatrix from rows 1-3, and columns 1-2
```

# Matrix – read data from a file

When data is being read from a file, you can imbed a call to scan into a call to matrix. Suppose we have a file called **matrix.dat** with the following contents:

```
7 12 19 4
18 7 12 3
9 5 8 42
```

We could create a 3x4 matrix, read in by rows, with the following command:

```
> A <- matrix(scan('matrix.dat'), nrow=3, byrow=TRUE)
```

```
> A
```

```
      [,1] [,2] [,3] [,4]
[1,]    7   12   19    4
[2,]   18    7   12    3
[3,]    9    5    8   42
```

# Matrix

In case, the data has to be entered row wise, then a  $4 \times 2$ -matrix  $X$  can be created with

```
> x = matrix( nrow=4, ncol=2, data=c(1,2,3,4,  
5,6,7,8), byrow = TRUE)
```

```
> x
```

|      | [,1] | [,2] |
|------|------|------|
| [1,] | 1    | 2    |
| [2,] | 3    | 4    |
| [3,] | 5    | 6    |
| [4,] | 7    | 8    |

# Transpose of matrix in R

**Transpose of a matrix  $X$ :  $X'$**

**Consider the matrix**

$$x = \begin{pmatrix} 1 & 5 \\ 2 & 6 \\ 3 & 7 \\ 4 & 8 \end{pmatrix}$$

```
> x = matrix( nrow=4, ncol=2, data=c(1,2,3,4,
5,6,7,8), byrow = FALSE)
```

```
> x
      [,1] [,2]
[1,]    1    5
[2,]    2    6
[3,]    3    7
[4,]    4    8
```

# Transpose of matrix in R – contd.

```
> xt <- t(x)
```

```
> xt
```

|      | [,1] | [,2] | [,3] | [,4] |
|------|------|------|------|------|
| [1,] | 1    | 2    | 3    | 4    |
| [2,] | 5    | 6    | 7    | 8    |

# Multiplication of a matrix with a constant

```
> x = matrix(nrow=4, ncol=2, data=c(1,2,3,4,  
5,6,7,8), byrow=T )
```

```
> x
```

|      | [,1] | [,2] |
|------|------|------|
| [1,] | 1    | 2    |
| [2,] | 3    | 4    |
| [3,] | 5    | 6    |
| [4,] | 7    | 8    |

```
> 5*x
```

|      | [,1] | [,2] |
|------|------|------|
| [1,] | 5    | 10   |
| [2,] | 15   | 20   |
| [3,] | 25   | 30   |
| [4,] | 35   | 40   |

# Matrix multiplication: operator %\*%

```
> x = matrix(nrow=4, ncol=2, data=c(1,2,3,4,  
5,6,7,8), byrow=T)
```

```
> x
```

|      | [,1] | [,2] |
|------|------|------|
| [1,] | 1    | 2    |
| [2,] | 3    | 4    |
| [3,] | 5    | 6    |
| [4,] | 7    | 8    |

```
> xt <- t(x)
```

```
> xt
```

|      | [,1] | [,2] | [,3] | [,4] |
|------|------|------|------|------|
| [1,] | 1    | 3    | 5    | 7    |
| [2,] | 2    | 4    | 6    | 8    |

```
> xtx = t(x) %*% x
```

```
> xtx
```

|      | [,1] | [,2] |
|------|------|------|
| [1,] | 84   | 100  |
| [2,] | 100  | 120  |

# 2x4 matrix %\*% 4x2 matrix

# 2x2 matrix

# Special matrices – constant matrix

Matrix where all  $m$  rows and  $n$  columns are filled by a single constant 'k'.

Command : `matrix(k,m,n)`

```
> matrix(7, 4, 3)
```

```
# k=7, m=4, n=3
```

|      | [,1] | [,2] | [,3] |
|------|------|------|------|
| [1,] | 7    | 7    | 7    |
| [2,] | 7    | 7    | 7    |
| [3,] | 7    | 7    | 7    |
| [4,] | 7    | 7    | 7    |

# Unit Matrix

Command : `matrix(1,m,n)`

```
> matrix(1, 4, 3)
      [,1] [,2] [,3]
[1,]    1    1    1
[2,]    1    1    1
[3,]    1    1    1
[4,]    1    1    1
```

```
# k=1, m=4, n=3
```

# Zero Matrix

Command : `matrix(0,m,n)`

```
> matrix(0, 4, 3)
      [,1] [,2] [,3]
[1,]    0    0    0
[2,]    0    0    0
[3,]    0    0    0
[4,]    0    0    0
```

```
# k=0, m=4, n=3
```

# Diagonal matrix

Command: `diag(k,m,n)`

First parameter k as constant/array

```
> diag(5, 3, 4)
```

|      | [,1] | [,2] | [,3] | [,4] |
|------|------|------|------|------|
| [1,] | 5    | 0    | 0    | 0    |
| [2,] | 0    | 5    | 0    | 0    |
| [3,] | 0    | 0    | 5    | 0    |

```
# k=5, m=3, n=4
```

# Identity matrix

The identity matrix is a special case of diagonal matrix where  $k = 1$ , and  $m = n$

Command: **diag(1,n,n)**

```
> diag(1,4,4)
```

|      | [,1] | [,2] | [,3] | [,4] |
|------|------|------|------|------|
| [1,] | 1    | 0    | 0    | 0    |
| [2,] | 0    | 1    | 0    | 0    |
| [3,] | 0    | 0    | 1    | 0    |
| [4,] | 0    | 0    | 0    | 1    |

# Symmetric Matrix

```
> C <- matrix(c(2,1,5,1,3,4,5,4,-2),3,3)
```

```
> C
```

```
      [,1] [,2] [,3]  
[1,]    2    1    5  
[2,]    1    3    4  
[3,]    5    4   -2
```

```
> CT <- t(C)
```

```
> CT
```

```
# Observe that C = CT
```

```
>      [,1] [,2] [,3]  
> [1,]    2    1    5  
> [2,]    1    3    4  
> [3,]    5    4   -2
```

**Note:** A symmetric matrix is a square matrix that is equal to its transpose.

# Inverse of a Matrix

```
> A <- matrix(c(4,4,-2,2,6,2,2,8,4),3,3)
```

```
> A
```

```
      [,1] [,2] [,3]  
[1,]    4    2    2  
[2,]    4    6    8  
[3,]   -2    2    4
```

```
> AI <- solve(A)
```

```
> AI
```

```
      [,1] [,2] [,3]  
[1,]  1.0 -0.5  0.5  
[2,] -4.0  2.5 -3.0  
[3,]  2.5 -1.5  2.0
```

# Inverse of a Matrix – contd.

```
> A %% AI
```

|      | [,1] | [,2] | [,3] |
|------|------|------|------|
| [1,] | 1    | 0    | 0    |
| [2,] | 0    | 1    | 0    |
| [3,] | 0    | 0    | 1    |

```
> AI %% A
```

|      | [,1] | [,2] | [,3] |
|------|------|------|------|
| [1,] | 1    | 0    | 0    |
| [2,] | 0    | 1    | 0    |
| [3,] | 0    | 0    | 1    |

The inverse of  $A$  is  $A^{-1}$  only when:

$$AA^{-1} = A^{-1}A = \mathbf{I}$$

# Names attribute

```
> vec <- 1:6
```

```
> vec
```

```
[1] 1 2 3 4 5 6
```

```
> names(vec)
```

```
NULL
```

```
> names(vec) <- c("one", "two", "three", "four", "five", "six")
```

```
> vec
```

```
one two three four five six
```

```
1 2 3 4 5 6
```

# Names attribute

To remove the names attribute, set it to NULL:

```
> names(vec) <- NULL
```

```
> vec
```

```
[1] 1 2 3 4 5 6
```

# Dim attribute

You can transform an atomic vector into an n-dimensional array by giving it a dimensions attribute with **dim**. To do this, set the dim attribute to a numeric vector of length n. R will reorganize the elements of the vector into n dimensions. Each dimension will have as many rows (or columns, etc.) as the nth value of the dim vector.

# Dim attribute

```
> vec <- 1:6
```

```
> vec
```

```
[1] 1 2 3 4 5 6
```

```
> dim(vec) <- c(2, 3)
```

```
> vec
```

|      | [,1] | [,2] | [,3] |
|------|------|------|------|
| [1,] | 1    | 3    | 5    |
| [2,] | 2    | 4    | 6    |
