

LL(1) Parsing

Parsing Techniques

Top-down parsers *(LL(1), recursive descent)*

- Start at the root of the parse tree and grow toward leaves
- Pick a production & try to match the input
- Bad “pick” \Rightarrow may need to backtrack
- Some grammars are backtrack-free *(predictive parsing)*

Bottom-up parsers *(LR(1), operator precedence)*

- Start at the leaves and grow toward root
- As input is consumed, encode possibilities in an internal state
- Start in a state valid for legal first tokens
- Bottom-up parsers handle a large class of grammars

Top-down Parsing

A top-down parser starts with the root of the parse tree

The root node is labeled with the goal symbol of the grammar

Top-down parsing algorithm:

Construct the root node of the parse tree

Repeat until lower fringe of the parse tree matches the input string

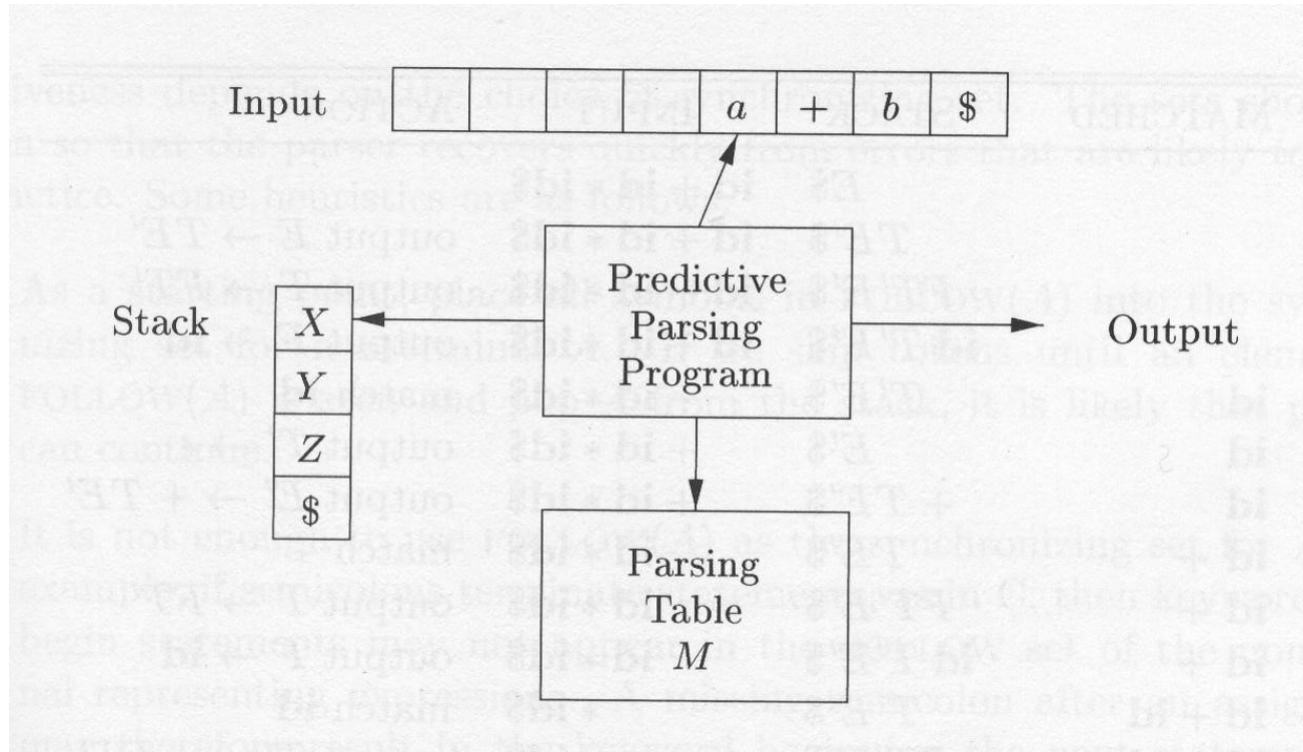

- 1 At a node labeled A, select a production with A on its lhs and, for each symbol on its rhs, construct the appropriate child*
- 2 When a terminal symbol is added to the fringe and it doesn't match the fringe, backtrack*
- 3 Find the next node to be expanded*

(label \in NT)

The key is picking the right production in step 1

- That choice should be guided by the input string*

Model of a table-driven predictive parser

Construction of a predictive parsing table

- The following rules are used to construct the predictive parsing table:

Consider the production $A \rightarrow \alpha$

- 1. for each terminal a in $\text{FIRST}(\alpha)$,
add $A \rightarrow \alpha$ to matrix $M[A,a]$
- 2. if λ is in $\text{FIRST}(\alpha)$, then
for each terminal b in $\text{FOLLOW}(A)$,
add $A \rightarrow \alpha$ to matrix $M[A,b]$

LL(1) Parsers (Cont.)

- Given the grammar:

- $E \rightarrow TE'$ 1
- $E' \rightarrow +TE'$ 2
- $E' \rightarrow \epsilon$ 3
- $T \rightarrow FT'$ 4
- $T' \rightarrow *FT'$ 5
- $T' \rightarrow \epsilon$ 6
- $F \rightarrow (E)$ 7
- $F \rightarrow id$ 8

LL(1) Parsers (Cont.)

$\text{FIRST}(F) = \text{FIRST}(T) = \text{FIRST}(E) = \{ (, \text{id} \}$

$\text{FIRST}(E') = \{ +, \lambda \}$

$\text{FIRST}(T') = \{ *, \lambda \}$

$\text{FOLLOW}(E) = \text{FOLLOW}(E') = \{), \$ \}$

$\text{FOLLOW}(T) = \text{FOLLOW}(T') = \{ +,), \$ \}$

$\text{FOLLOW}(F) = \{ +, *,), \$ \}$

LL(1) Parsers (Cont.)

Non-terminal	Input symbols					
	Id	+	*	()	\$
E	$E \rightarrow TE'$			$E \rightarrow TE'$		
E'		$E' \rightarrow +TE'$			$E' \rightarrow \epsilon$	$E' \rightarrow \epsilon$
T	$T \rightarrow FT'$			$T \rightarrow FT'$		
T'		$T' \rightarrow \epsilon$	$T' \rightarrow *FT'$		$T' \rightarrow \epsilon$	$T' \rightarrow \epsilon$

LL(1) Parsers (Cont.)

Stack	Input	Output
\$E	id + id * id \$	
\$E'T	id + id * id \$	$E \rightarrow TE'$
\$E'T'F	id + id * id \$	$T \rightarrow FT'$
\$E'T'id	id + id * id \$	$F \rightarrow id$
\$E'T'	+ id * id \$	match id
\$E'	+ id * id \$	$T' \rightarrow \lambda$
\$E'T+	+ id * id \$	$E' \rightarrow +TE'$

LL(1) Parsers (Cont.)

Stack	Input	Output
\$E'T	id * id \$	match +
\$E'T'F	id * id \$	$T \rightarrow FT'$
\$E'T'id	id * id \$	$F \rightarrow id$
\$E'T'	* id \$	match id
\$E'T'F*	* id \$	$T' \rightarrow *FT'$
\$E'T'F	id \$	match *
\$E'T'id	id \$	$F \rightarrow id$
\$E'T'	\$	match id
\$E'	\$	$T' \rightarrow \lambda$
\$	\$	$E' \rightarrow \lambda$

A Grammar G is LL(1) if

$A \rightarrow \alpha \mid \beta$ are two distinct productions of grammar G , G is LL(1) if the following 3 conditions hold:

1. $\text{FIRST}(\alpha)$ cannot contain any terminal in $\text{FIRST}(\beta)$.
2. At most one of α and β can derive λ .
3. if $\beta \rightarrow^* \lambda$, $\text{FIRST}(\alpha)$ cannot contain any terminal in $\text{FOLLOW}(A)$.
if $\alpha \rightarrow^* \lambda$, $\text{FIRST}(\beta)$ cannot contain any terminal in $\text{FOLLOW}(A)$.

Homework 1

Construct the LL(1) table for the following grammar:

- 1 $\text{Expr} \rightarrow - \text{Expr}$
- 2 $\text{Expr} \rightarrow (\text{Expr})$
- 3 $\text{Expr} \rightarrow \text{Var ExprTail}$
- 4 $\text{ExprTail} \rightarrow - \text{Expr}$
- 5 $\text{ExprTail} \rightarrow \lambda$
- 6 $\text{Var} \rightarrow \text{id VarTail}$
- 7 $\text{VarTail} \rightarrow (\text{Expr})$
- 8 $\text{VarTail} \rightarrow \lambda$

Homework 1 Solution

$\text{First}(\text{Expr}) = \{-, (, \text{id}\}$

$\text{First}(\text{ExprTail}) = \{-, \lambda\}$

$\text{First}(\text{Var}) = \{\text{id}\}$

$\text{First}(\text{VarTail}) = \{(, \lambda\}$

$\text{Follow}(\text{Expr}) = \text{Follow}(\text{ExprTail}) = \{\$,)\}$

$\text{Follow}(\text{Var}) = \{\$,), -\}$

$\text{Follow}(\text{VarTail}) = \{\$,), -\}$

Homework 1 Solution (Cont.)

Non-Terminal	Input Symbol				
	-	(id)	\$
Expr	1	2	3		
ExprTail	4			5	5
Var			6		
VarTail	8	7		8	8

Homework 2

- Given the grammar:
 - $S \rightarrow i E t S S' \mid a$
 - $S' \rightarrow e S \mid \lambda$
 - $E \rightarrow b$
- 1. Find the first set and follow set.
- 2. Build the parsing table.

Homework 2 Solution

$$\text{First}(S) = \{i, a\}$$

$$\text{First}(S') = \{e, \lambda\}$$

$$\text{First}(E) = \{b\}$$

$$\text{Follow}(S) = \text{Follow}(S') = \{\$, e\}$$

$$\text{Follow}(E) = \{t\}$$

Homework 2 Solution (Cont.)

Non-Terminal	Input Symbol					
	a	b	e	i	t	\$
S	2			1		
S'			3/4			4
E		5				

As $\text{First}(S')$ contains λ and $\text{Follow}(S') = \{\$, e\}$ So rule 4 is added to e, \$.
 3/4 (rule 3 or 4) means an error. This is not LL(1) grammar.

Example:

Grammar

$E \rightarrow TE'$

$E' \rightarrow +TE' \mid \epsilon$

$T \rightarrow FT'$

$T' \rightarrow *FT' \mid \epsilon$

$F \rightarrow (E) \mid id$

(ϵ stands for epsilon)

First and Follow

Symbol	FIRST	FOLLOW
E	(,id	\$,)
E'	+,ë	\$,)
T	(,id	+,\$,)
T'	*,ë	+,\$,)
F	(,id	*,+,\$,)

Building the table

	Id	+	*	()	\$
E	$E \rightarrow TE'$			$E \rightarrow TE'$		
E ,		$E' \rightarrow +TE'$			$E' \rightarrow \ddot{e}$	$E' \rightarrow \ddot{e}$
T	$T \rightarrow FT'$			$T \rightarrow FT'$		
T ,		$T' \rightarrow \ddot{e}$	$T' \rightarrow *FT'$		$T' \rightarrow \ddot{e}$	$T' \rightarrow \ddot{e}$
F	$F \rightarrow id$				$F \rightarrow (E)$	

Input=id+id*id

Stack	Input buffer
$\$E$	$id+id*id\$$
$\$E'T'$	$Id+id*id\$$
$\$E'T'F$	$Id+id*id\$$
$\$E'T'id$	$Id+id*id\$$
$\$E'T'$	$+id*id\$$
$\$E'$	$+id*id\$$
$\$E'T+$	$+id*id\$$
$\$E'T$	$id*id\$$

Stack	Input Buffer
$\$E'T'F$	$id*id\$$
$\$E'T'id$	$id*id\$$
$\$E'T'$	$*id\$$
$\$E'T'F*$	$*id\$$
$\$E'T'F$	$id\$$
$\$E'T'id$	$id\$$
$\$E'T'$	$\$$
$\$E'$	$\$$
$\$$	Accepted

Thus, we can easily construct an LL parse with 1 lookahead. Since one look ahead is involved, we also call it an LL(1) parser.

There are grammars which may require LL(k) parsing.

For e.g. look at next example.....
