Introduction to Relational Model Chapter - 2

Database System Concepts, 6th Ed.

©Silberschatz, Korth and Sudarshan

Example of a Relation

A Sample Relational Database

instructor

ID	name	dept_name	salary
22222	Einstein	Physics	95000
12121	Wu	Finance	90000
32343	El Said	History	60000
45565	Katz	Comp. Sci.	75000
98345	Kim	Elec. Eng.	80000
76766	Crick	Biology	72000
10101	Srinivasan	Comp. Sci.	65000
58583	Califieri	History	62000
83821	Brandt	Comp. Sci.	92000
15151	Mozart	Music	40000
33456	Gold	Physics	87000
76543	Singh	Finance	80000

department

dept_name	building	budget
Comp. Sci.	Taylor	100000
Biology	Watson	90000
Elec. Eng.	Taylor	85000
Music	Packard	80000
Finance	Painter	120000
History	Painter	50000
Physics	Watson	70000

Attribute Types

- Each attribute of a relation has a name
- The set of allowed values for each attribute is called the domain of the attribute
- Attribute values are (normally) required to be atomic, that is, indivisible
 - E.g. multivalued attribute values are not atomic
 - E.g. composite attribute values are not atomic
- ☐ The special value *null* is a member of every domain
- The null value causes complications in the definition of many operations

Relation Schema

- \Box $A_1, A_2, ..., A_n$ are attributes
- $R = (A_1, A_2, ..., A_n)$ is a **relation schema** E.g.

instructor = (ID, name, dept_name, salary)

Customer-schema =

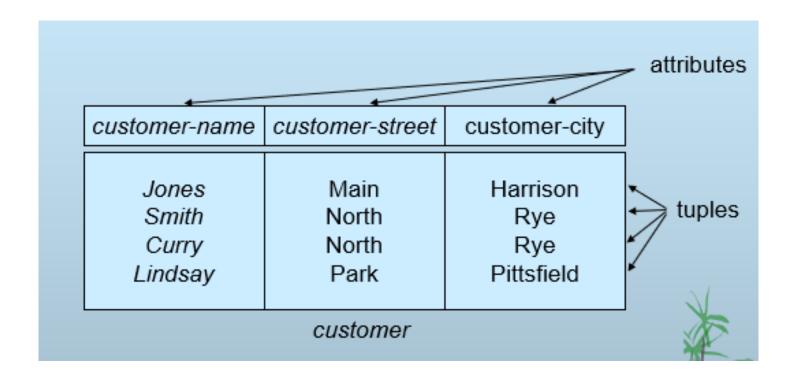

(customer-name, customer-street, customer-city)

- Formally, given sets D₁, D₂, Dₙ a relation r is a subset of D₁ x D₂ x ... x Dₙ
 Thus, a relation is a set of n-tuples (a₁, a₂, ..., aₙ) where each aᵢ ∈ Dᵢ
- □ *r*(*R*) is a *relation* on the *relation schema R* E.g. customer (Customer-schema)

Relation Instance

- The current values (relation instance) of a relation are specified by a table
- □ An element *t* of *r* is a *tuple*, represented by a *row* in a table

Relations are Unordered

- □ Order of tuples is irrelevant (tuples may be stored in an arbitrary order)
- □ Example: *instructor* relation with unordered tuples

ID	name	dept_name	salary
22222	Einstein	Physics	95000
12121	Wu	Finance	90000
32343	El Said	History	60000
45565	Katz	Comp. Sci.	<i>7</i> 5000
98345	Kim	Elec. Eng.	80000
76766	Crick	Biology	72000
10101	Srinivasan	Comp. Sci.	65000
58583	Califieri	History	62000
83821	Brandt	Comp. Sci.	92000
15151	Mozart	Music	40000
33456	Gold	Physics	87000
76543	Singh	Finance	80000

Database

- A database consists of multiple relations
- Information about an enterprise is broken up into parts

```
instructor - ID, name, salary, departmentstudent - ID, name, program, credits, advisoradvisor - ID, name, topic
```

Bad design:

```
university (instructor_ID, name, dept_name, salary, student_ID, ...) results in
```

- repetition of information (e.g., two students have the same instructor)
- the need for null values (e.g., represent an student with no advisor)
- Normalization theory deals with how to design relational schemas

Keys

- □ Let $K \subset R$
- ☐ K is a superkey of R if values for K are sufficient to identify a unique tuple of each possible relation r(R)
 - □ Example: {ID} and {ID,name} are both superkeys of instructor.
- □ Superkey *K* is a **candidate key** if *K* is minimal Example: {*ID*} is a candidate key for *Instructor*
- One of the candidate keys is selected to be the primary key.
 - which one?

Primary Key

- Primary key: a candidate key chosen as the principal means of identifying tuples within a relation.
 - Should choose an attribute whose value never, or very rarely, changes.
 - □ E.g. *email address* is unique, but may change
 - When choosing a primary key from the pool of candidate keys always choose a single simple key over a composite key.

Examples:

- □ *department*(*dept name*, *building*, *budget*)
- □ *classroom*(*building*, *room number*, *capacity*)
- □ course(<u>course id</u>, title, dept name, credits)
- □ *instructor*(*ID*, *name*, *dept name*, *salary*)
- □ student(<u>ID</u>, name, dept name, tot cred)

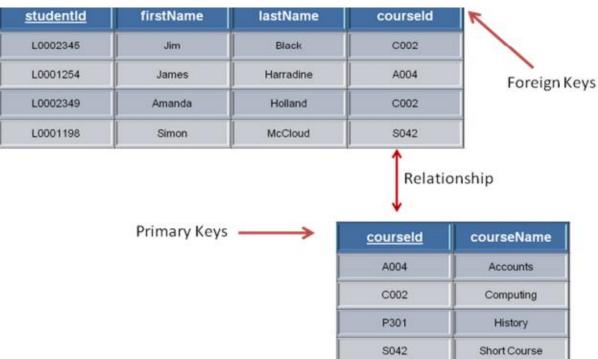

Foreign Key

- ☐ Foreign key constraint: Value in one relation must appear in another
 - Referencing relation, Referenced relation
 - E.g. dept_name in instructor is a foreign key from instructor referencing department

A foreign key is generally a primary key from one table that appears as a field in another where the first table has a relationship to the

second.

Schema Diagram for University Database

A database schema, along with primary key and foreign key dependencies, can be depicted by schema diagrams.
